摘要： The rise of information and communication technologies (ICT) has facilitated flexible working arrangements, giving rise to new workspaces like co-working spaces (CWS). While existing research has focused on the distribution of CWS within city, this study explores their location patterns and relationships with regional policies in China. Using data from 2015 to 2022, it employs a quasi-natural experiment at the prefecture level, primarily examining the impact of National Innovation Demonstration Zone (NIDZ) policy. This pilot policy primarily aims to reform the science and technology innovation mechanism in the pilot cities.
